

Goals

- Motivate integration
- Sigma ( $\Sigma$ ) notation
- Riemann sums

E.g. Suppose object travels east with velocity  $v(t)$  m/s at time  $t$  seconds. What is the change in the object's position from  $t=0$  to  $t=10$ ?

$$\rightsquigarrow s(10) - s(0) = ?$$

$s(t) = \text{pos'n at time } t \text{ (m)}$

If  $v(t) = c$  is constant, this is simple:

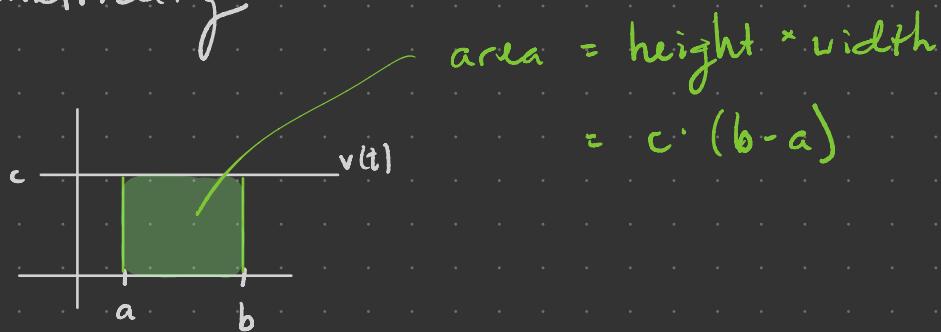

distance = const velocity  $\times$  time

$$\text{so } s(10) - s(0) = c \cdot (10 - 0)$$

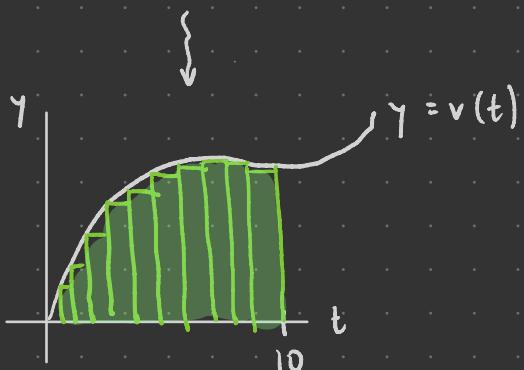

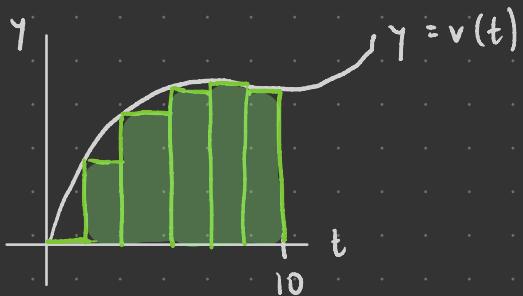

More generally,

$$s(b) - s(a) = c \cdot (b - a) \quad \text{for } a \leq b.$$

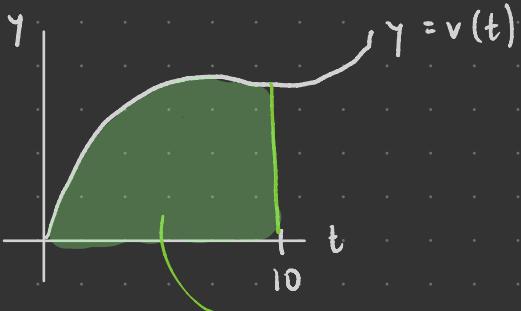

Geometrically:

Divide and conquer : Approximate displacement by pretending  $v(t)$  is constant on small intervals :

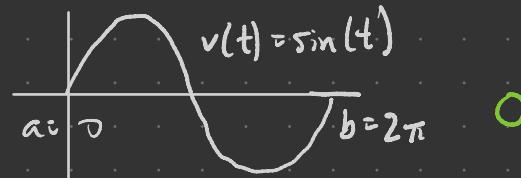

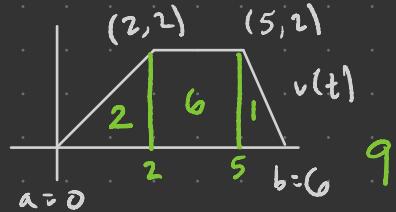

And "in the limit"

this area equals  $s(10) - s(0)$ .

It is also  $\int_0^{10} v(t) dt$

Problems For the following velocity graphs, find the displacement [total change in position] from  $t=a$  to  $t=b$

Let's formalize:

Defn Fix  $a \leq b$ . A set of points  $P = \{x_0, x_1, \dots, x_n\}$  with  $a = x_0 < x_1 < x_2 < \dots < x_n = b$  is called a partition of  $[a, b]$ .

If the subintervals all have the same width, the set of points forms a regular partition of the interval  $[a, b]$ .

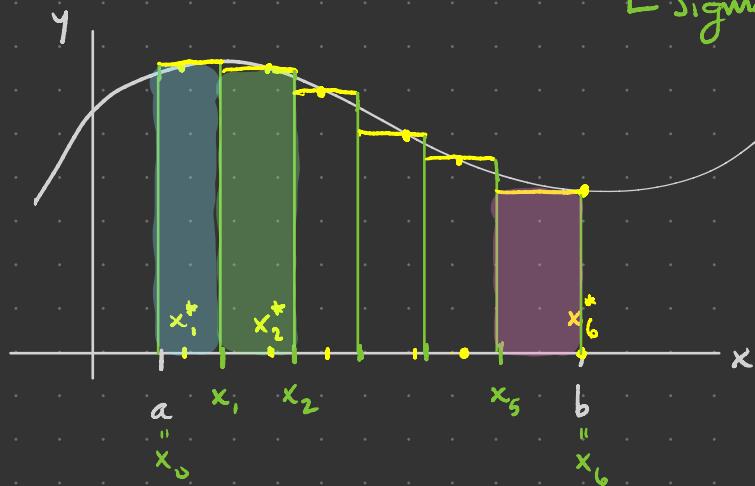

Defn Let  $f: [a, b] \rightarrow \mathbb{R}$  be a function,  $P = \{x_0, x_1, \dots, x_n\}$  be a regular partition of  $[a, b]$  with subinterval width  $\Delta x = x_i - x_{i-1}$ .

For each  $i$ , let  $x_i^*$  be some point of  $[x_{i-1}, x_i]$ . The Riemann sum for  $f$  over  $[a, b]$  relative to  $P, \{x_i^*\}$  is

$$f(x_1^*) \Delta x + f(x_2^*) \Delta x + \dots + f(x_n^*) \Delta x = \sum_{i=1}^n f(x_i^*) \Delta x_i.$$

↳ Sigma notation — more soon!

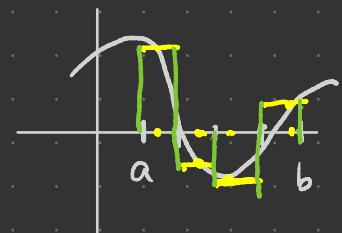

$$y = f(x)$$

Flavors of Riemann sum:

Left, right, midpoint, upper, lower.

Note The "area"  $f(x_i^*) \Delta x$  is negative when  $f(x_i^*) < 0$ .  
 ↪ "signed area"

Upshot Signed area under curve between  $a, b$  is

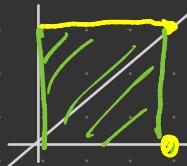

$$\approx f(x_1^*)\Delta x + f(x_2^*)\Delta x + \dots + f(x_n^*)\Delta x$$

(especially for  $n$  large  $\Rightarrow \Delta x$  small).

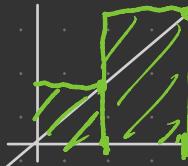

If  $f(t) = v(t)$  is velocity, this is  $\approx$  displacement from  $a$  to  $b$ .

Problem Find right Riemann sum for  $f(x) = x$  on  $[0, 1]$

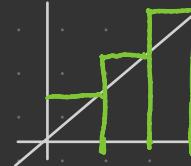

with  $n = 1, 2, 3, 4$ .

1

$$\frac{1}{2} \cdot \frac{1}{2} + 1 \cdot \frac{1}{2} = \frac{3}{4}$$

$$\frac{1}{3} \cdot \frac{1}{3} + \frac{2}{3} \cdot \frac{1}{3} + 1 \cdot \frac{1}{3} = \frac{2}{3}$$

$$\frac{1}{4} \cdot \frac{1}{4} + \frac{1}{2} \cdot \frac{1}{4} + \frac{3}{4} \cdot \frac{1}{4} + 1 \cdot \frac{1}{4}$$

$$= \frac{5}{8}$$

## Sigma notation

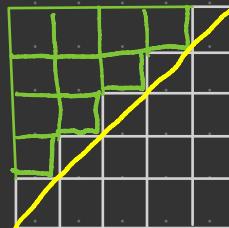

$\sum$  = Greek S for Sum.

Sequence  $(a_i)_{i=1}^{\infty} = (a_1, a_2, a_3, a_4, \dots)$

$\sum_{i=1}^n a_i := a_1 + a_2 + a_3 + \dots + a_n = \sum_{1 \leq i \leq n} a_i$

**Start**  $\rightarrow$  E.g. If  $a_i = i$ , then  $\sum_{i=1}^n a_i = \sum_{i=1}^n i = 1 + 2 + 3 + \dots + n$

is the sum of the first  $n$  positive integers.

$n \times n$  square

$n^2$  total squares  
 $\frac{1}{2}n^2 + \frac{1}{2}n = \frac{n^2+n}{2} = \frac{n(n+1)}{2}$

$$\sum_{i=3}^5 \sin(\pi \cdot i)$$

$$= \sin(\pi \cdot 3)$$

$$+ \sin(\pi \cdot 4)$$

$$+ \sin(\pi \cdot 5)$$

Thus  $\sum_{i=1}^n i = \frac{n(n+1)}{2}$

Check  $1 = \frac{1 \cdot 2}{2}$

$$1+2 = 3 = \frac{2 \cdot 3}{2}$$

$$1+2+3 = 6 = \frac{3 \cdot 4}{2}$$

$$1+2+3+4 = 10 = \frac{4 \cdot 5}{2}$$

$$1+2+3+4+5 = 15 = \frac{5 \cdot 6}{2} \quad \checkmark$$

Let's return to the right hand Riemann sum for  $f(x) = x$  over  $[0, 1]$ :

$$R_n = \sum_{i=1}^n f(x_i^*) \Delta x$$

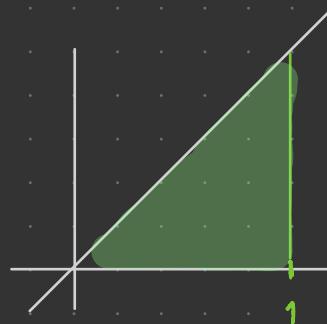

↗ n-th right

$$0 \frac{1}{n} \frac{2}{n} \frac{3}{n} \dots \frac{n}{n}$$

$$\text{Riemann sum} = \sum_{i=1}^n \frac{i}{n} \cdot \frac{1}{n}$$

$$= \frac{1}{n^2} \left\{ \sum_{i=1}^n i \right\} \quad [\text{factor out } \frac{1}{n^2}]$$

$$= \frac{1}{n^2} \cdot \frac{n(n+1)}{2}$$

$$= \frac{n+1}{2n} \xrightarrow{n \rightarrow \infty} \frac{1}{2} = \int_0^1 x \, dx$$

$f(x) = x$

$$\begin{array}{c|c|c|c|c} n & 1 & 2 & 3 & 4 \\ \hline \frac{n+1}{2n} & \frac{2}{2} & \frac{3}{4} & \frac{4}{6} = \frac{2}{3} & \frac{5}{8} \end{array}$$

$$R_{500} = \frac{501}{1000}$$
